SafePause: demo video script

K! Hacks 4.0, FinTech track. Target length: 3 minutes. Two speakers (A = team lead, B = member).

Before recording

- Run the prototype: open a terminal in prototype/ and type python3 server.py then open http://localhost:8600 in Chrome, full screen (F11), 1920 x 1080.
- Click Reset, then "Full video run". The run takes about 2 minutes and plays the three stories with captions on top.
- A raw screen recording of exactly this run is already in video/SafePause_demo_screen_recording.mp4. You can record your voice over it instead of re-recording the screen.
- Speak slowly. Read the lines below in your own words; do not read the captions out word for word.
- Upload as Unlisted on YouTube. Put the link in reference [13] on slide 7.

Time	On screen	Say (in your own words)
0:00-0:15	Slide 2 (problem) or a face-to-camera shot	A: "In 2025, Indians reported 28 lakh frauds and lost about twenty-three thousand crore rupees. RBI says most of these are not hacks. The victim makes the payment himself, with the right PIN, from his own phone."
0:15-0:30	Slide 2, quote box	B: "In February this year the Chief Justice asked the banks: why didn't your AI tools alarm him that this transaction was suspicious? We built something that does."
0:30-0:42	Demo, step 1-2: Kamala's app, Family safety screen	A: "Meet Kamala, 74, from Chennai. Fake CBI officers have kept her on a video call for two days. Yesterday they made her close her 18 lakh fixed deposit. When she opened her account, she added her son Arun as a trusted contact."
0:42-0:55	Demo, step 3: she pastes the account details and enters her PIN	B: "Still on the call, she is told to move 4.8 lakh to an 'RBI safe custody account'. The details come on WhatsApp. She pastes them and pays."
0:55-1:05	Demo, step 4: phone says 'processing'; pipeline lights up	A: "SafePause scores the payment in about 25 milliseconds: a huge amount, first time to this account, on a call with an unknown number, details pasted. It pauses it. Her screen only says 'processing', so the scammer on the call hears

		nothing unusual."
1:05-1:15	Demo, step 5: son's phone	B: "Arun gets a message: your mother is sending 4.8 lakh to a new account, do you know about it? He doesn't. He taps 'No, stop it'."
1:15-1:35	Demo, step 6: officer console	A: "The case goes to a bank officer with the reasons in plain words. The receiving account is 11 days old and got 41 credits from 9 states in two days. The officer calls Kamala. Her reason, 'case verification', doesn't match the payee name."
1:35-1:50	Demo, step 7-8: stopped, money back; second try goes straight to hold	B: "The officer stops it. 4.8 lakh is back in her account, with a warning in Tamil. The scammers try again with another account. This time it goes straight to an officer hold."
1:50-2:10	Demo: fake investment (Rahul)	A: "Not every scam has a phone call. Rahul, 29, joined a WhatsApp stock-tips group. They sent him 1,200 rupees of fake 'profit', then asked for 10,000. SafePause sees money from a stranger followed by a first payment to a new account, and stops it at the first payment, before it grows into lakhs."
2:10-2:20	Demo: genuine bike booking paid instantly	B: "And when Rahul books a bike for 45,000 at a new dealer, it just goes through. No pause, no pop-up."
2:20-2:40	Slide 5 chart	A: "We tested this on a synthetic bank of 30,000 customers, calibrated to RBI's own fraud numbers, including scam types the model never saw. SafePause stopped 83% of scam money while delaying 1 in 200 genuine payments. A one-hour delay on every payment stopped 11% and delayed ten times more people. These are simulated results, so our next step is a shadow pilot on real bank data."
2:40-2:55	Slide 6	B: "Banks pay, because from January 2027 they carry more of the loss. We start with co-operative and small finance banks: about two rupees per user per month."
2:55-3:00	Title card: SafePause	A: "SafePause. Pause only the risky

		payments, don't tip off the scammer, and let a person decide."

Likely judge questions and short answers

Q: Isn't this what RBI already proposed?

A: RBI's options apply to everyone: a one-hour lag on every payment above Rs 10,000, or a trusted person for every payment above Rs 50,000 by people over 70. RBI's own paper asks whether the lag should be based on the bank's risk assessment. SafePause is that risk-based version.

Q: Is hiding the hold from the customer legal or ethical?

A: The customer agrees to it when opening the account, the screen wording is true ("processing, can take up to 4 hours"), the money never leaves their account, and a person decides. UK law already lets banks hold a suspicious payment for up to 4 business days.

Q: Can a bank app really know the customer is on a call?

A: Android lets apps read whether a call is active (phone state) without reading the call. Google already shows in-call scam warnings for finance apps in India, the UK and Brazil. We only use "a call is on" and "the number is not saved".

Q: Your numbers are from synthetic data.

A: Yes, and we say so on every slide. We calibrated it to RBI's figures, tested on unseen scam types and ran 200 versions of uncertain human behaviour. The next step is a 3-month shadow pilot with a co-operative bank: score only, nobody paused.

Q: What if the family member is the scammer, or isn't available?

A: The family member can only answer for medium-risk payments. A 'yes' for a high-risk payment does not release it; the officer still decides. If nobody answers, a medium pause ends after 30 minutes. Changing the contact needs a 24-hour cooling period, as RBI suggests.

Q: What about scams it misses?

A: One-shot scams like a fake KYC call are caught less often (about 35-40%) because there is no pattern yet. Telecom signals such as DoT's FRI can help there.
